

SYSTEM AND METHOD OF DATA MINING

ABSTRACT OF THE DISCLOSURE

A system and method for mining data for intelligent patterns uses logical techniques to isolate unique patterns and reduce the patterns to a consistent set of rules representing the data. The system and method eliminates attributes in the patterns that do not contribute to an associated conclusion and are deemed irrelevant. This approach does not splinter significant patterns within the data, as may occur with statistical approaches.

In addition, the system and method identifies areas of incomplete data that are not recognized in other methods.
